42 Sim Project Objectives

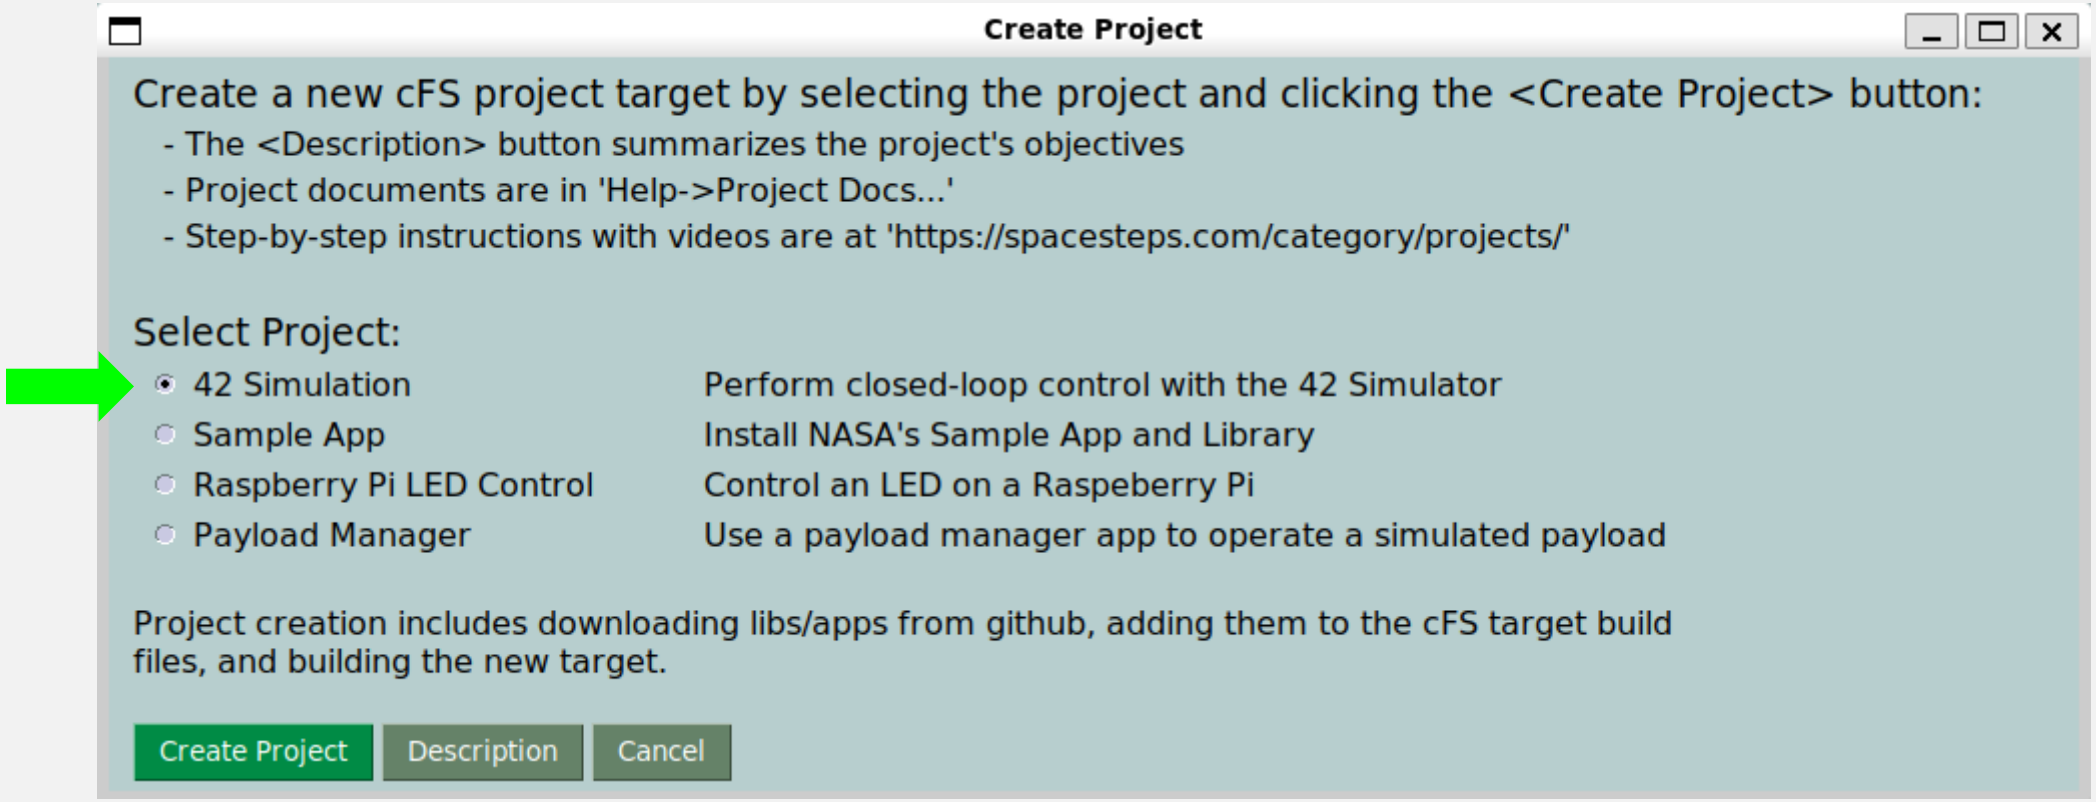
This project enables you to run a spacecraft attitude controller in a cFS app in a closed-loop simulation using the 42 simulator. Closed-loop simulation is a method of running a system by connecting a controller to a simulator that models the time-varying behavior of the spacecraft and its environment.

Detailed project instructions with videos can be found at

https://spacesteps.com/TODO/

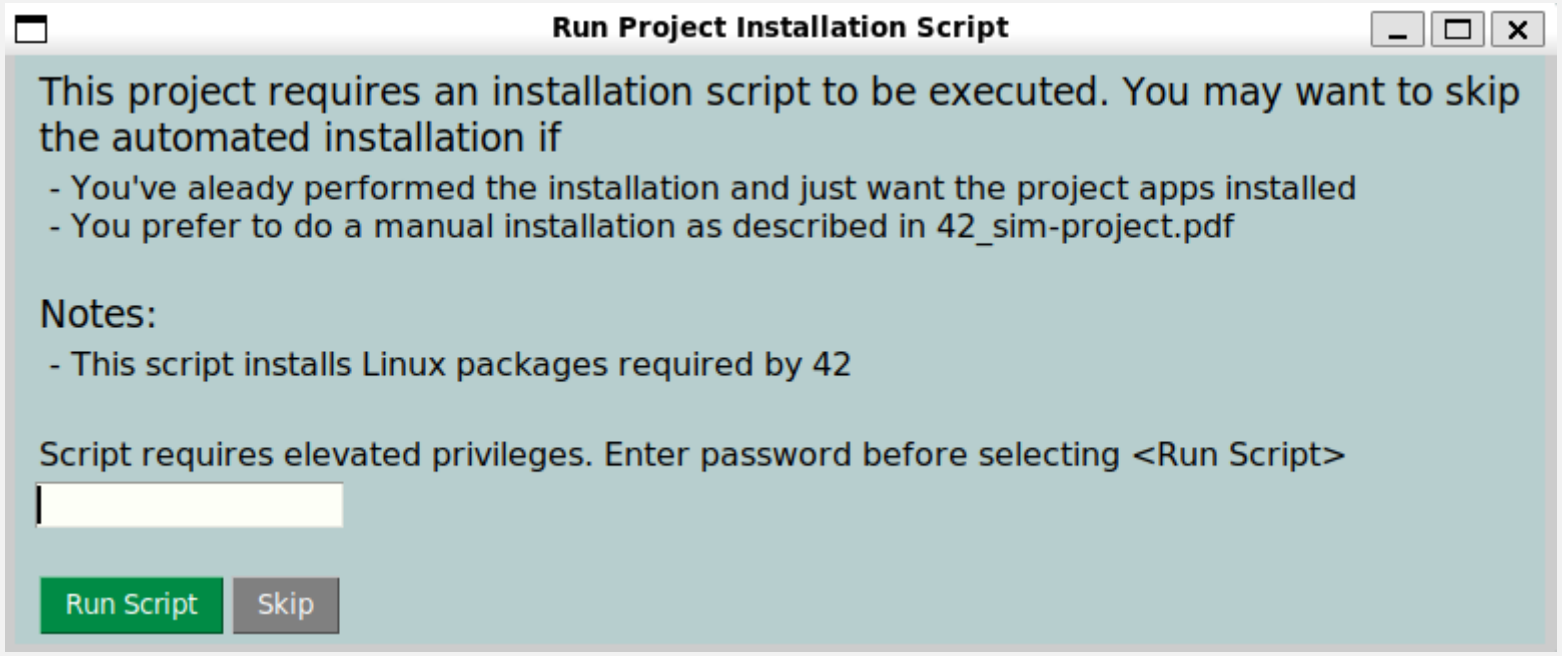
Software Installation (1 of 4)

This project requires a library and two apps to be installed into the cFS target. It also requires the 42 Simulator to be downloaded from github, configured and built in its “Standalone” mode.



Software Installation (2 of 3)

This window allows the gnd-sys/projects/42-sim/*42_sim_project.sh* script to be run from the GUI.

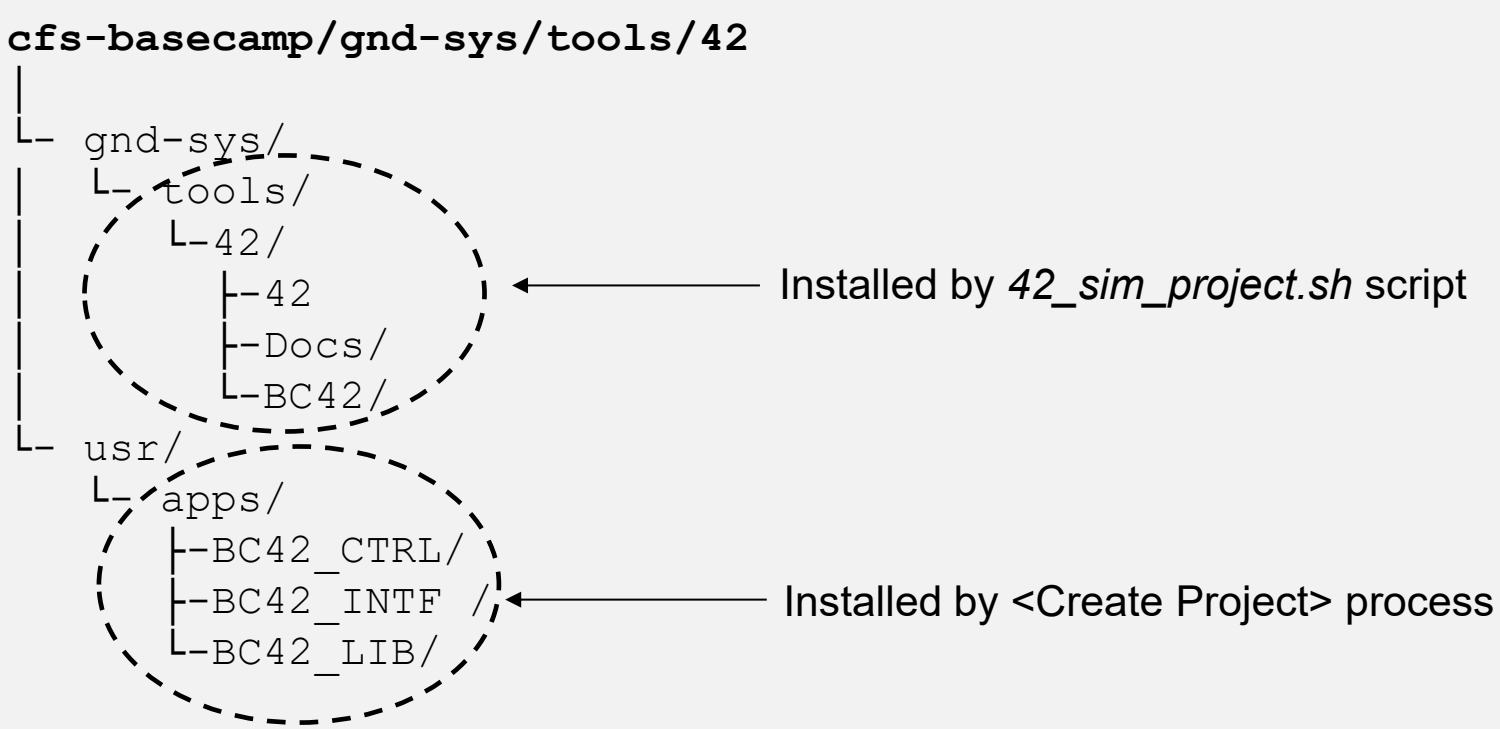


Notes:

1. The *42_sim_project.sh* script serves as the 42-installation documentation

Software Installation (3 of 3)

42 is installed Basecamp's ground system tools directory.



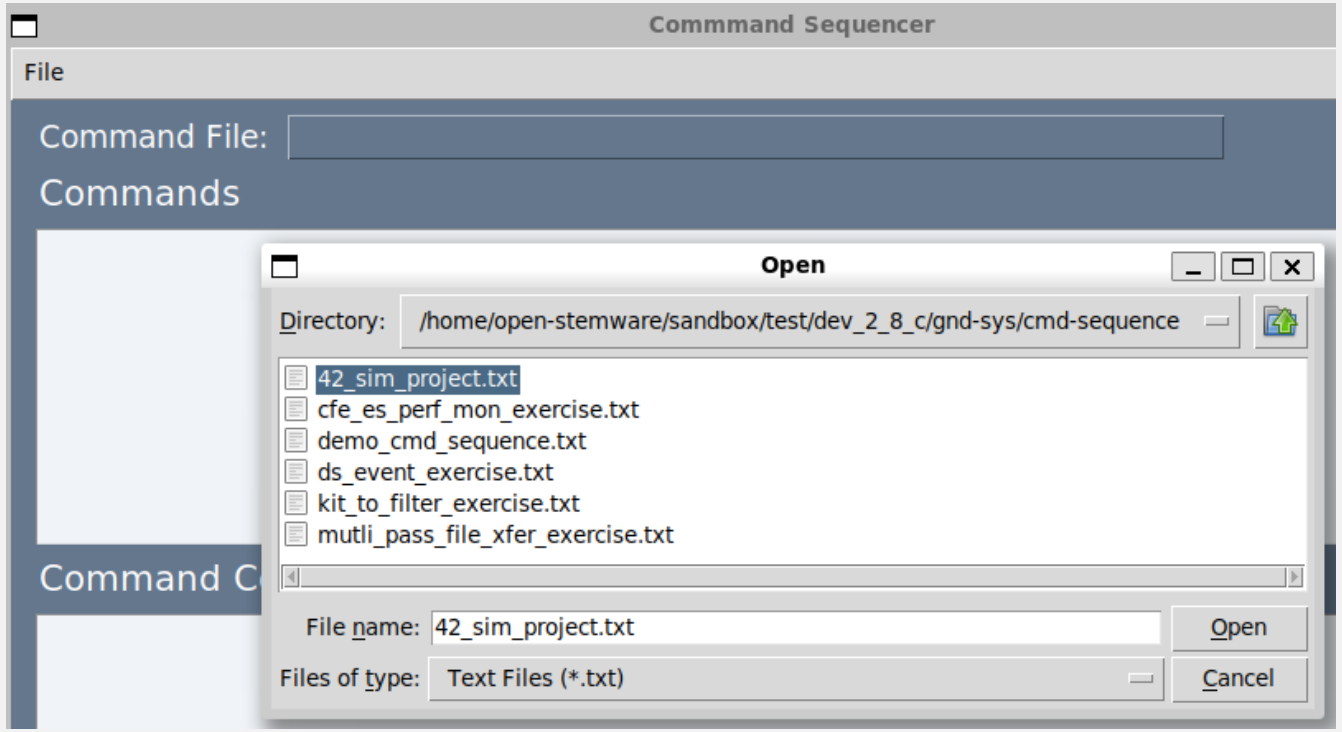
Running a Simulation (1 of 4)

1. Start 42
   A. Open a new terminal window
   B. Change directory to /gnd-sys/tools/42
   C. Start 42 ‘./42 BC42’
   D. Multiple blank windows should appear and you should see the follow output in the terminal window

```
open-stemware@Open-STEMware:~/sandbox/42$ ./42 BC42
0.0 SC[0] qrl = [0.0  0.0  0.0  1.0]
Reached CmdScript EOF at Time = 0.000000
Initializing GLUT
Initializing Cam Window
Loading Cam Shaders
Loading Cam Textures
Loading 3D Noise
Loading Cam Lists
Cam Window Width = 800
Cam Window Height = 800
Cam Screen Width = 1600
Cam Screen Height = 900
Done Initializing Cam Window
Server is listening on port 10001
```

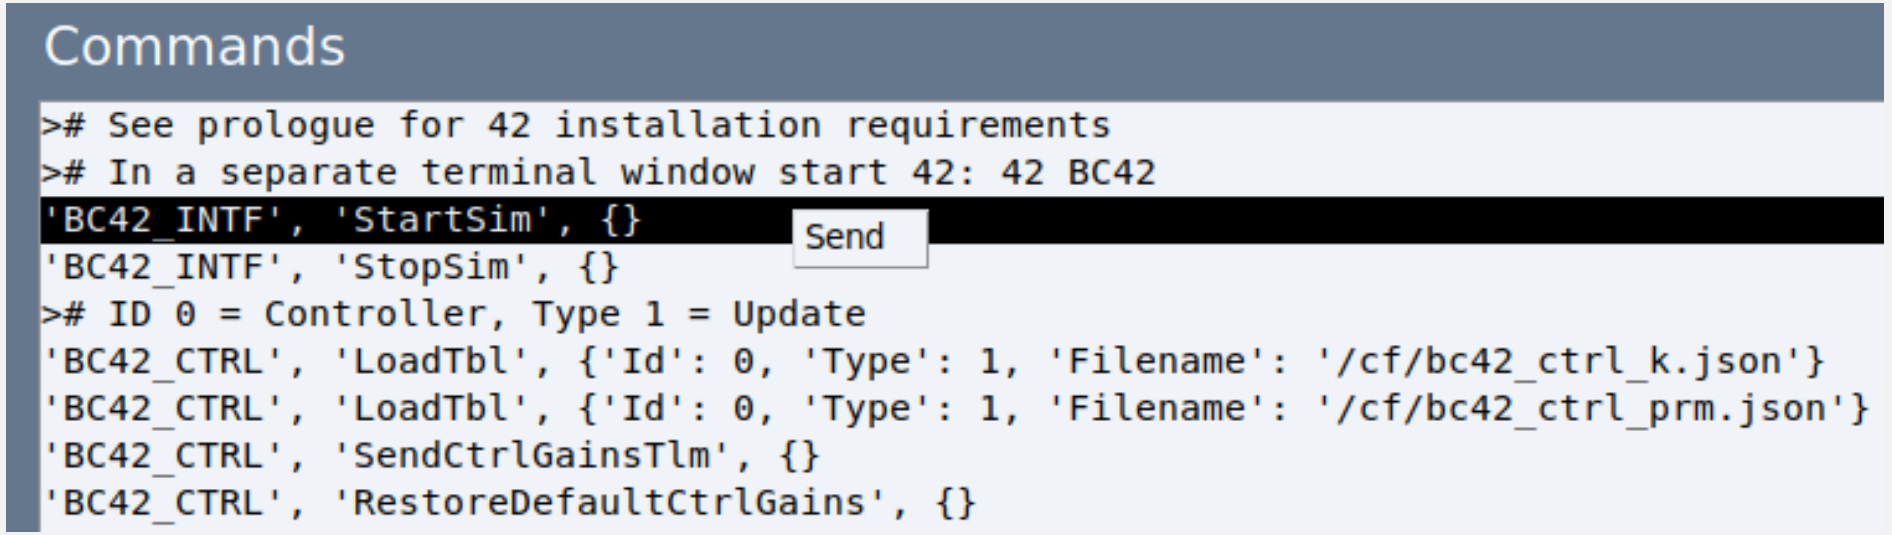
Running a Simulation (2 of 4)

2. Start Basecamp and then start the cFS
3. Launch the *Command Sequencer* from the Tools menu and open the 42_sim_project.txt file



Running a Simulation (3 of 4)

4. **Send the BC42_INTF StartSim command**
   A. Highlight the StartSim command line
   B. Right click and select Send



Running a Simulation (4 of 4)

The blank 42 screen should be populated
